

# RADON AND INDOOR AIR QUALITY (IAQ)

Radon is one of the pollutants of indoor air

Opening windows should only be considered a temporary measure as it is an ineffective way of reducing the presence of radon in the long term.

## Ventilation of the building is not the only way of reducing radon.

Other methods exist such as sealing the part of the building in contact with the ground, soil depressurisation systems or ventilation beneath the building as these are often more effective.

Efficient corrective actions to reduce radon are often an appropriate combination of the above techniques tailored to the specific situation.
